Thromboembolism in AF (AFFIRM database)

- Not all strokes in AF are cardioembolic
- Mostly due to lack of or subtherapeutic anticoagulation
- Current assessment of the absence of all AF unsatisfactory – asymptomatic AF

	N= 4060
All strokes	211(8.2%)
Ischemic strokes	157(6.3%)
1° Intra-cerebral h'hage	34(1.2%)
Subdural/arachnoid h'hage	24(0.8%)
Ischemic stroke mechanism	
Cardioembolic	35/71(49.3%)
Atheroembolic	12/71(16.9%)
Lacunar	19/71(26.8%)
Unknown	86 (54.8%)
Probably cardioembolic	50/83(60.2%)

Cardioembolic + probably cardioembolic stroke = 55%

Sherman et al, Arch Intern Med. 2005;165:1185-1191

Cardioembolic vs. Noncardioembolic Strokes in Atrial Fibrillation

- 3,950 participants in the Stroke Prevention in Atrial Fibrillation I–III clinical trials
- Strokes were classified by presumed mechanism
- 217 ischemic strokes:
  - 52% classified as probably cardioembolic
  - 24% noncardioembolic, and
  - 24% of uncertain cause (i.e., 68% of classifiable infarcts were deemed cardioembolic)
- 56% ischemic strokes in AF patients taking warfarin were noncardioembolic vs. 16% of in those taking aspirin.

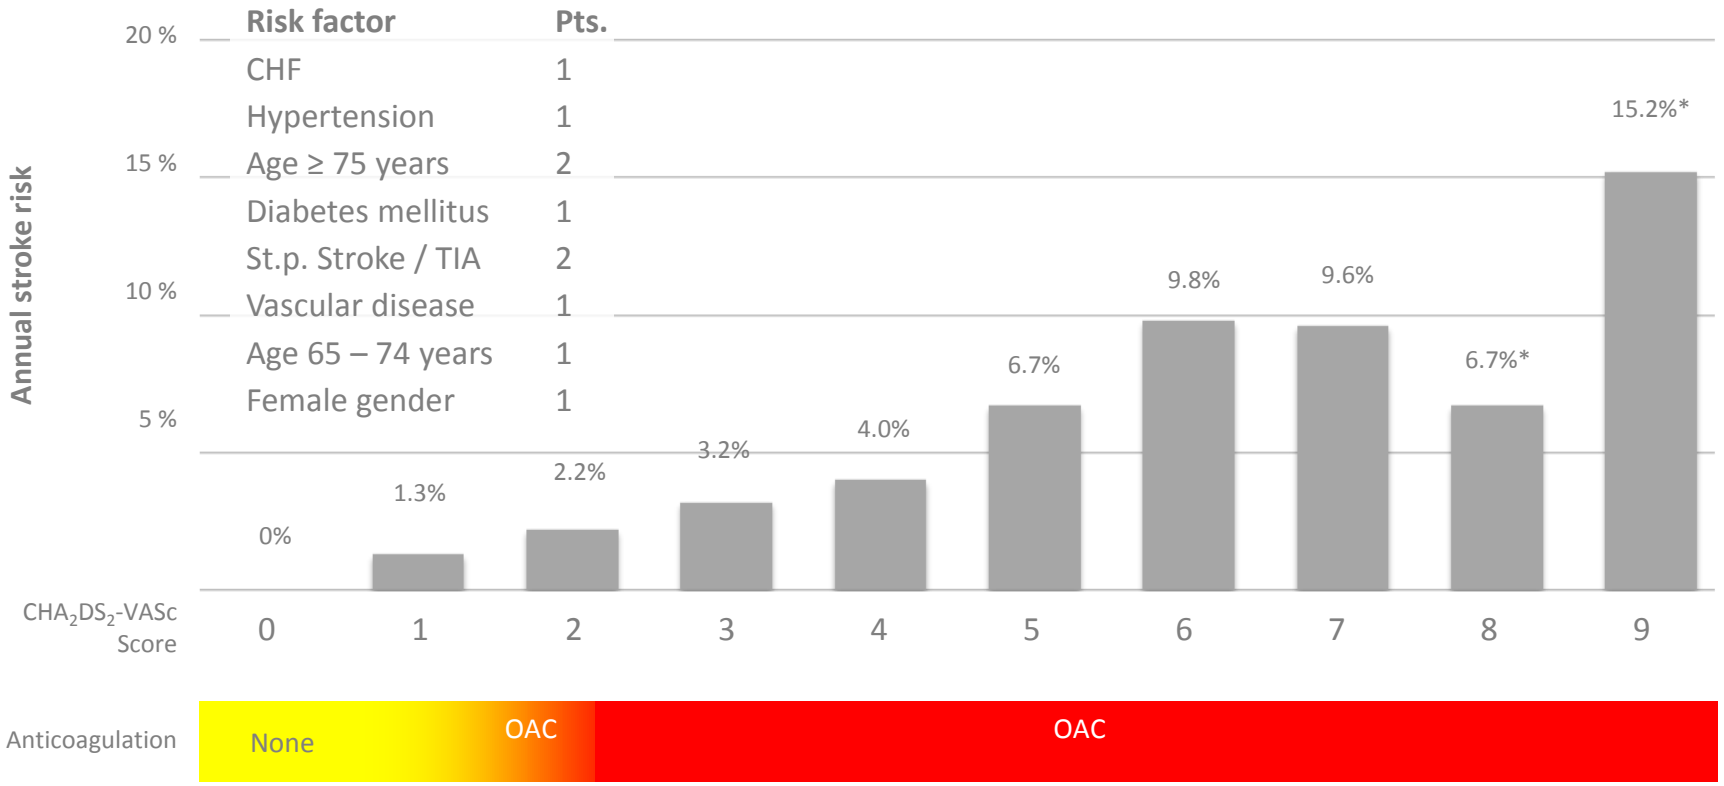
Hart R.G et al, Cerebrovasc Dis 2000;10:39–43

Is atrial fibrillation always a culprit of stroke in patients with atrial fibrillation plus stroke?

- Consecutive patients with ischemic stroke within 7 days of symptom onset and with AF
- Of 522 patients, 424 (81.2%) were grouped as AF-related stroke and the remaining 90 (17.2%) were classified as AF-unrelated stroke
- Of AF-unrelated stroke, 51 (9.8%) were categorized as possible large artery atherosclerosis and 38 (7.3%) as possible small artery occlusion
- AF is not always a culprit of stroke in patients with AF plus ischemic stroke; approximately one sixth are unrelated to AF and have distinct characteristics compared to AF-related stroke.

Kim SJ et al, Cerebrovasc Dis. 2013;36(5-6):373-82

Assessment of major and relevant risk factors



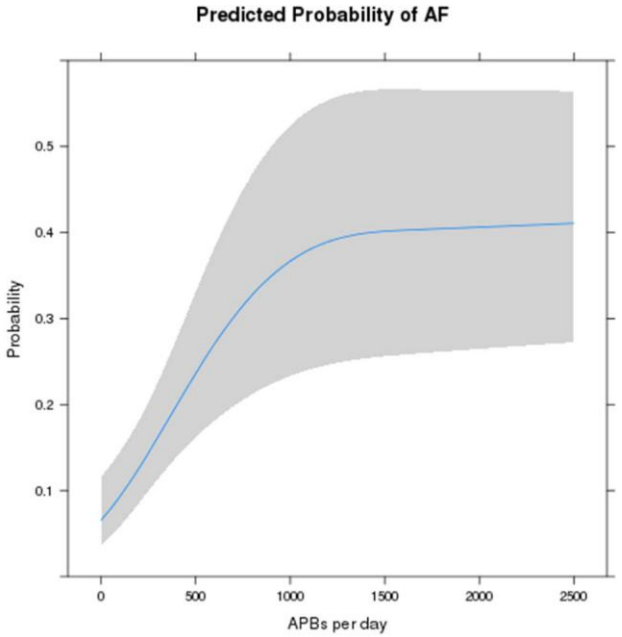
*ASA + Clopidogrel only, if patient does not tolerate or wish OAC (NOAC / VKA) – not because of bleeding issues[1]

1. Adapted from Camm AJ et al. Eur Heart J. 2012 Nov;33(21):2719-47.

Predictors of Ischemic Stroke

- **Well accepted: CHA2DS2VASC score**
- **Others**
  - High rate episodes
  - Duration, atrial fibrillation category
  - LA size: diameter, planimetered area, volume
  - LA contractility, LAA emptying velocity, SEC in LA
  - LA scars
  - Signal averaged P wave duration
  - Interatrial block

Stroke and Atrial ectopics, LA volume, P wave duration etc..



- Cryptogenic stroke or TIA w/o known AF
- 30-day ECG monitoring with an AF auto-detect external loop recorder
- Holter APB count/24 h

Table Characteristics of all cases and of those with and without AF identified

	All	No AF	AF	*p* Value
Age, y	51.5 (13.9)	48.9 (13.9)	59.2 (11.0)	0.018
Male, n (%)	28 (54.9)	22 (57.9)	6 (46.2)	0.5
Interval to insertion, d	174 (134)	181 (148)	151 (74)	0.5
CHADS2	2 (2-3)	2 (2-3)	3 (2-3.5)	0.003
CHA2DS2-VASc	3 (2-4)	3 (2-3)	4 (3.5-4)	0.001
Pre-ILR monitoring, d	1 (1-2)	1 (1-2)	1 (1-1.5)	0.9
APC per day	5 (1-23)	5 (1-13)	44 (5-765)	0.004
LA volume indexed, mL/m^2	25.6 (9.57)	23.1 (9.6)	30.6 (10.0)	0.025
Max P-wave duration, ms	121 (14.6)	120.5 (15.3)	125.8 (8.6)	0.3
Interatrial block, n (%)	25 (49)	16 (48.5)	9 (90.0)	0.02
PFO[b]	22/30	18/25	4/5	0.71

- Cohort study of 51 cryptogenic stroke patients with IL
- AF identified in 25.5%

Cotter et al, Neurology" 2013;80:1546–1550

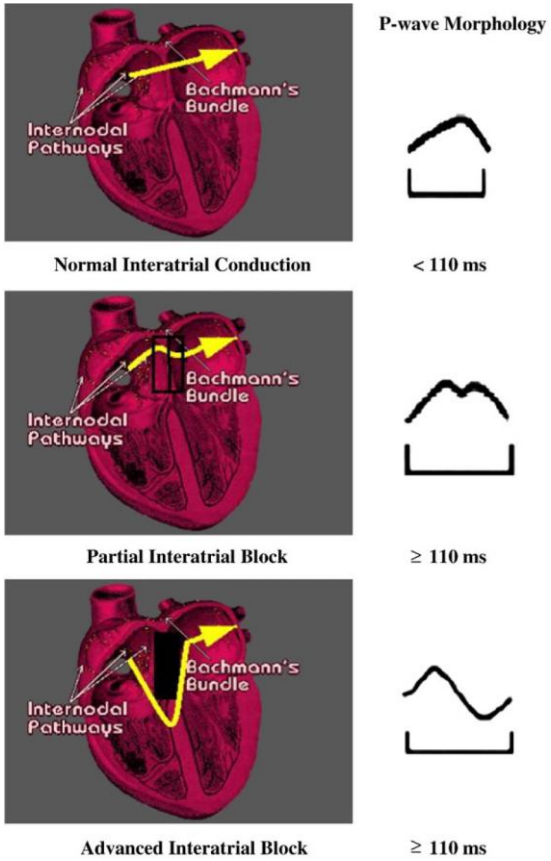
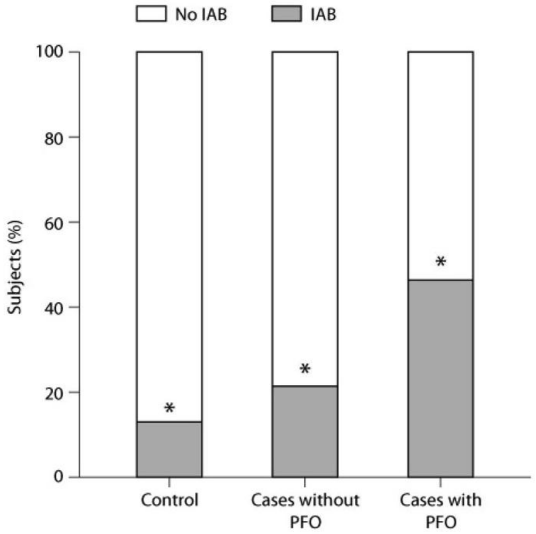
Abnormal atrial activation

- **Normal P-wave duration: less than 110 milliseconds**
  - normal transit time throughout the right and left atrium (RA and LA)
- **Interatrial block: prolonged conduction time between RA and LA resulting in prolonged P-wave duration ≥110 ms.**
- **IAB has associations LA enlargement, AF, other SVTs, systemic emboli, and myocardial ischemia**
- **Associated with PFO and stroke**





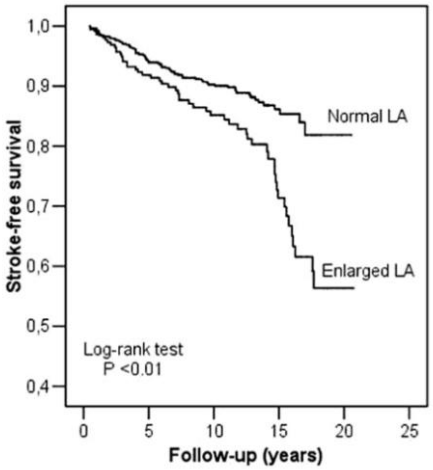
Cotter et al,
Cerebrovasc Dis Extra 2011;1:36–43

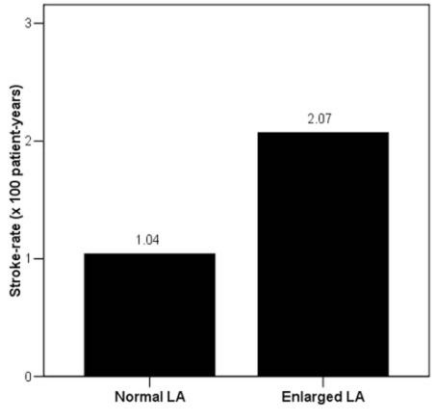
Kitkungvan et al, Journal of Electrocardiology 42 (2009) 687–692

Left atrial enlargement and stroke in hypertension

Table 2. Results of univariable analysis

Parameter	HR (95% CI)	*P* value
Age, 1 year	1.11 (1.09–1.14)	<0.01
Clinic SBP, 1 mm Hg	1.01 (1.00–1.02)	<0.01
Daytime SBP, 1 mm Hg	1.02 (1.01–1.04)	<0.01
Nighttime SBP, 1 mm Hg	1.03 (1.02–1.04)	<0.01
24-h SBP, 1 mm Hg	1.03 (1.02–1.04)	<0.01
Diabetes, yes vs. no	1.79 (1.09–2.94)	0.02
LV hypertrophy, yes vs. no	1.68 (1.19–2.35)	<0.01
Circadian BP changes group		
Dippers with MS <23 mm Hg	1.00 (referent)	
Dippers with MS >23 mm Hg	2.49 (1.44–4.31)	<0.01
Nondippers	2.10 (1.35–3.27)	<0.01
LA enlargement, yes vs. no	1.93 (1.36–2.72)	<0.01
New onset AF, yes vs. no	1.67 (0.99–2.82)	0.06
Previous events[a], yes vs. no	1.56 (0.84–2.91)	0.10
Sex, men vs. women	0.80 (0.57–1.13)	0.20

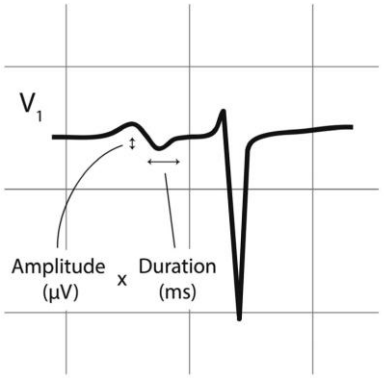




- **In elderly treated hypertensive patients (n=1191), LA enlargement is an independent predictor of ischemic stroke**

Pierdominco et al, American Journal of Hypertension 27(9), 201

P wave terminal forces and stroke



- 3129 community-dwelling adults aged ≥65 years
- Associations of ECG left atrial abnormality with brain infarcts
- Documented AF excluded
- Hypothesis: left atrial disease may produce a substrate for cardiac thrombus formation and embolization even in the absence of AF
- Increase in P-wave terminal force in lead V1 was associated with a higher baseline white matter grade
- associated with prevalent infarcts & non-lacunar infarcts

Table 1. Baseline Characteristics of Cardiovascular Health Study Participants, Stratified by Category of $PTFV_1$*

Characteristic†	$PTFV_1$=0 μV ms (n=758)	$PTFV_1$=207–2494 μV ms (n=799)	$PTFV_1$=2495–3780 μV ms (n=789)	$PTFV_1$=3781–19 474 μV ms (n=778)

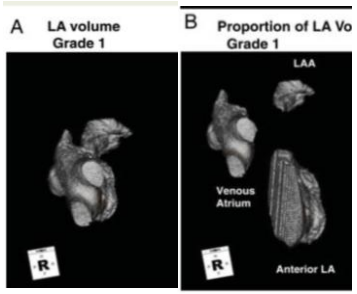
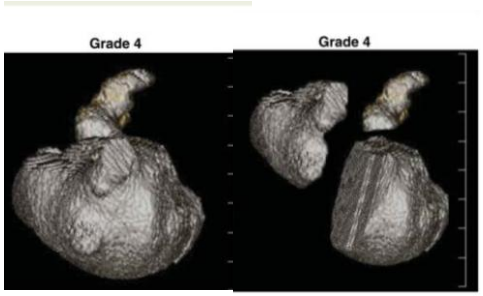
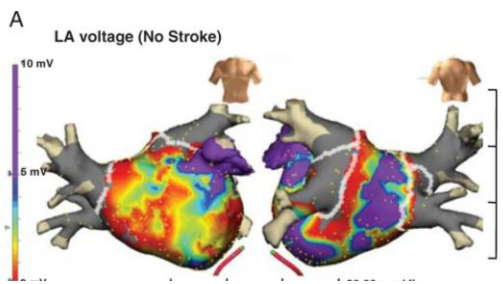
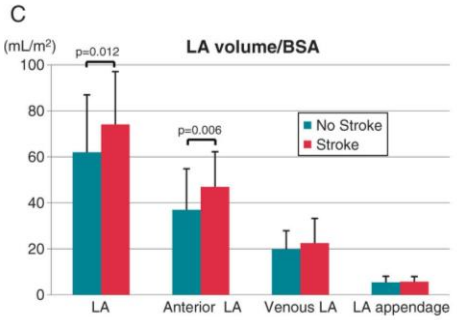
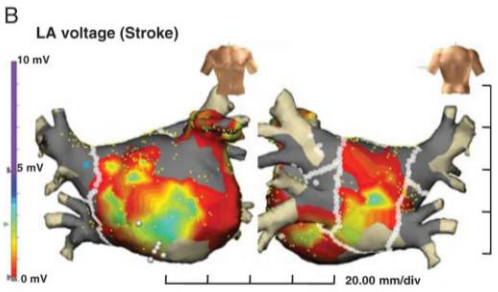
LA Voltages and prior stroke in AF











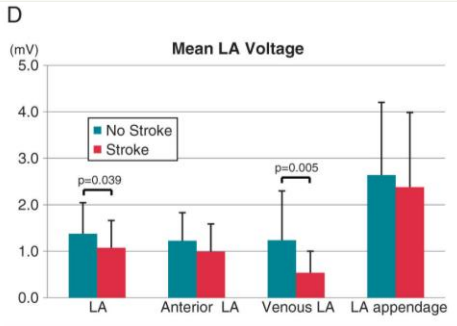


Table 4 Degree of left atrial remodelling in patients with and without stroke

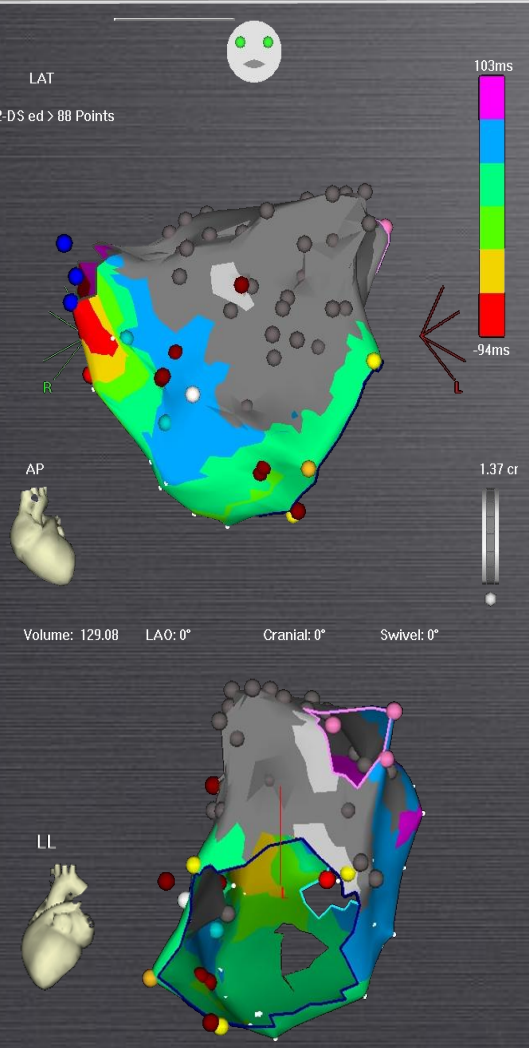
	No stroke (n = 326)	Stroke (n = 22)	P value
LA volumes/BSA (mL/m^2)			
Entire LA volume	61.5 ± 25.5	74.1 ± 23.0	$P = 0.012$
Anterior LA volume	36.9 ± 17.8	46.9 ± 15.3	$P = 0.006$
Venous LA volume	19.8 ± 8.0	22.5 ± 10.8	$P = 0.074$
LAA volume	5.4 ± 2.6	5.7 ± 2.3	$P = 0.329$
Relative volumes of regional LA (%)			
Anterior LA volume	59.3 ± 7.6	62.2 ± 8.0	$P = 0.044$
Venous LA volume	32.1 ± 7.4	30.6 ± 7.6	$P = 0.185$
LAA volume	8.6 ± 3.3	7.2 ± 2.1	$P = 0.025$
LA voltage (mV)			
Mean LA voltage	1.4 ± 0.7	1.1 ± 0.6	$P = 0.039$
Anterior LA	1.2 ± 0.6	1.0 ± 0.6	$P = 0.068$
Venous LA	1.2 ± 1.1	0.5 ± 0.5	$P = 0.005$
LAA	2.6 ± 1.6	2.4 ± 1.6	$P = 0.259$
LV function			
LVEF (%)	59.6 ± 8.6	63.0 ± 8.1	$P = 0.041$
E/E'	9.4 ± 3.8	10.5 ± 3.2	$P = 0.120$
Hypertension	144 (44.2%)	12 (54.5%)	$P = 0.216$
Renal insufficiency	6 (1.8%)	0 (0.0%)	$P = 0.673$
Recurrence	62 (19.0%)	0 (0.0%)	$P = 0.041$

Electroanatomical remodelling of LA, estimated by LA volume and endocardial voltage, has significant relationship with the risk scores or events of stroke in patients with non-valvular AF.

Park JH et al, Europace (2011) 13, 1541–1549

LAA dissociation



Effect of ablation on LA function

LA contractility and compliance are markedly impaired &. LA dysfunction is closely related to scar burden

Summary

- The standard risk factors account for the major part of stroke risk in atrial fibrillation
- There is likely a significant local left atrial component contributing to stroke risk in patients with atrial fibrillation
- Left atrial dysfunction or remodelling may contribute to stroke risk even without documented AF
- LA electrophysiological parameters may provide an early indication of this remodelling
