

Prof. Thomas ROSEMANN, Switzerland

Thomas Rosemann is general internist, chair for primary care at the University of Zurich and head of the department of primary care at the University Hospital Zurich. His field of research is health services research with a special focus on cardiovascular diseases. Starting in 2008, he established a nationwide GP research network in which the data of the electronic medical records of over 700 Swiss GPs are frequently uploaded to the university and available for extensive analysis. Covering over 1 million consultations with lab data and physiological parameters, this network represents one of the largest primary care based databases on a voluntarily base in the world.

With establishing evidence based quality indicators, including process as well as outcome indicators, one of the aims is to narrow the evidence-performance gap in the care of patients with cardiovascular diseases.
