Problems and challenges in cardiovascular emergencies

A strategy of <u>early fibrinolysis</u> followed by coronary angiography within 6-24 hours or rescue PCI if needed was compared with <u>standard primary PCI</u>

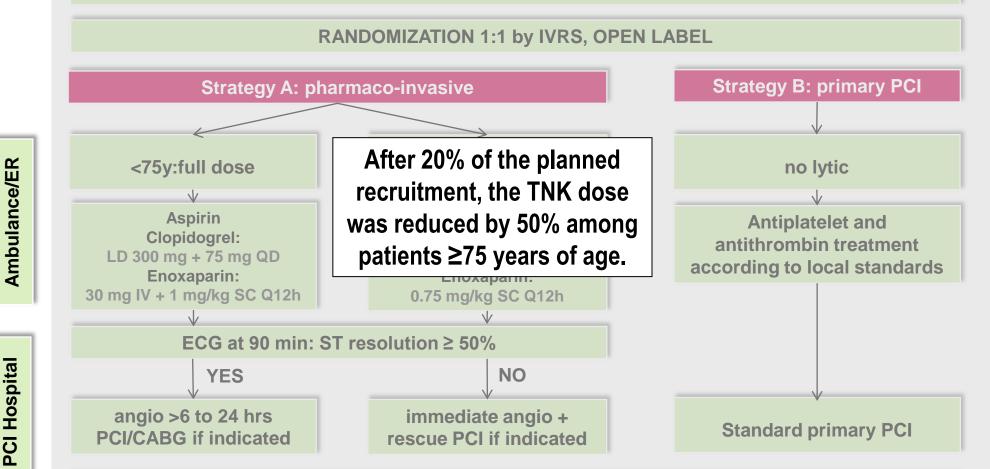

in

STEMI patients with at least 2 mm ST-elevation in 2 contiguous leads presenting within 3 hours of symptom onset and unable to undergo primary PCI within 1 hour.

STUDY PROTOCOL

STEMI <3 hrs from onset symptoms, PPCI <60 min not possible, 2 mm ST-elevation in 2 leads

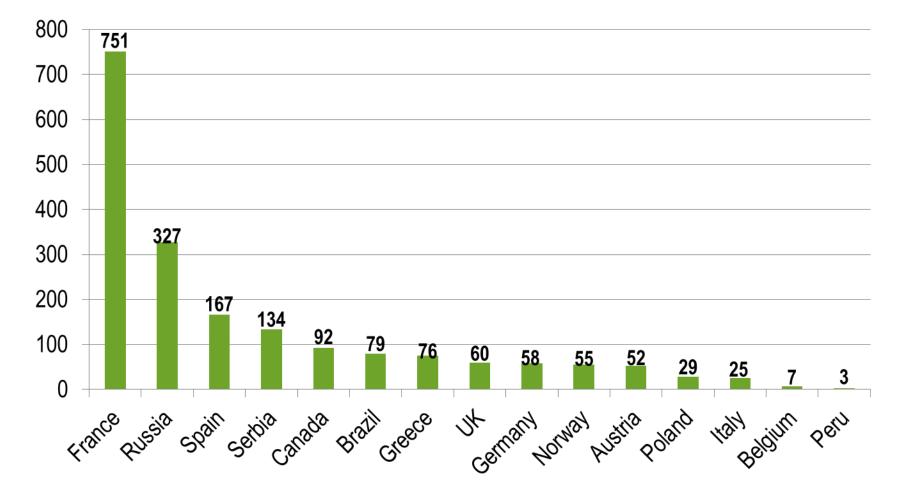

Primary endpoint: composite of all cause death or shock or CHF or reinfarction up to day 30

INVASIVE PROCEDURES

	Pharmaco-invasive (N=944)	PPCI (N=948)	P-value
PCI performed	80%	90%	<0.001
Stents deployed	96%	96%	0.95
CABG performed	4.7%	2.1%	0.002

PRIMARY ENDPOINT

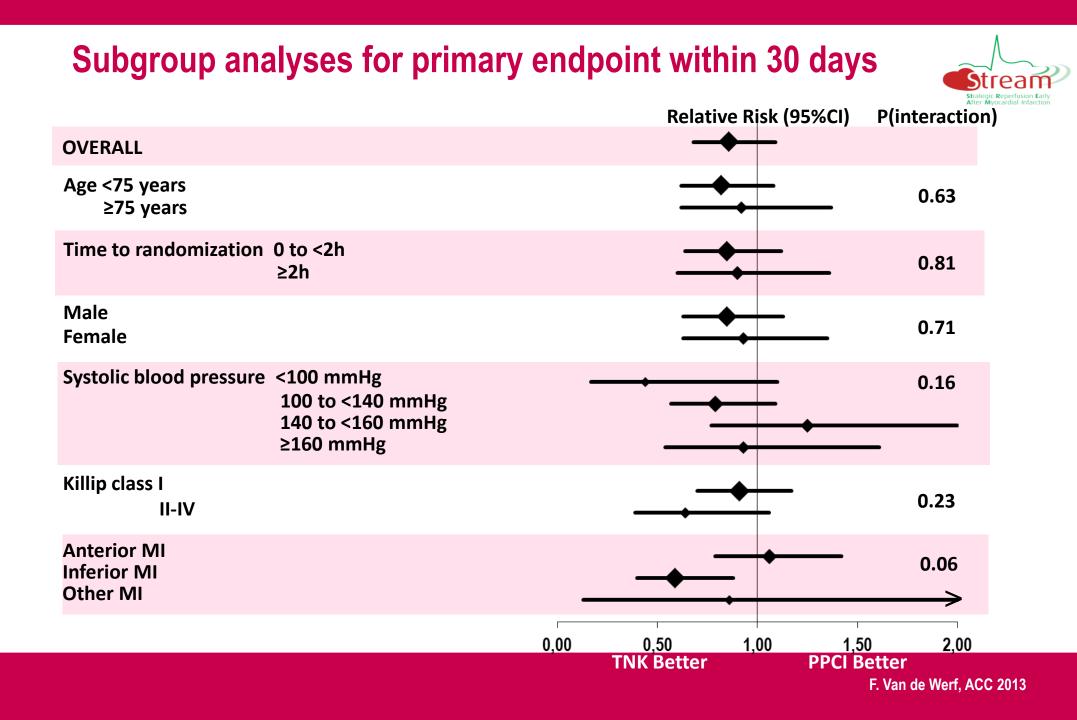

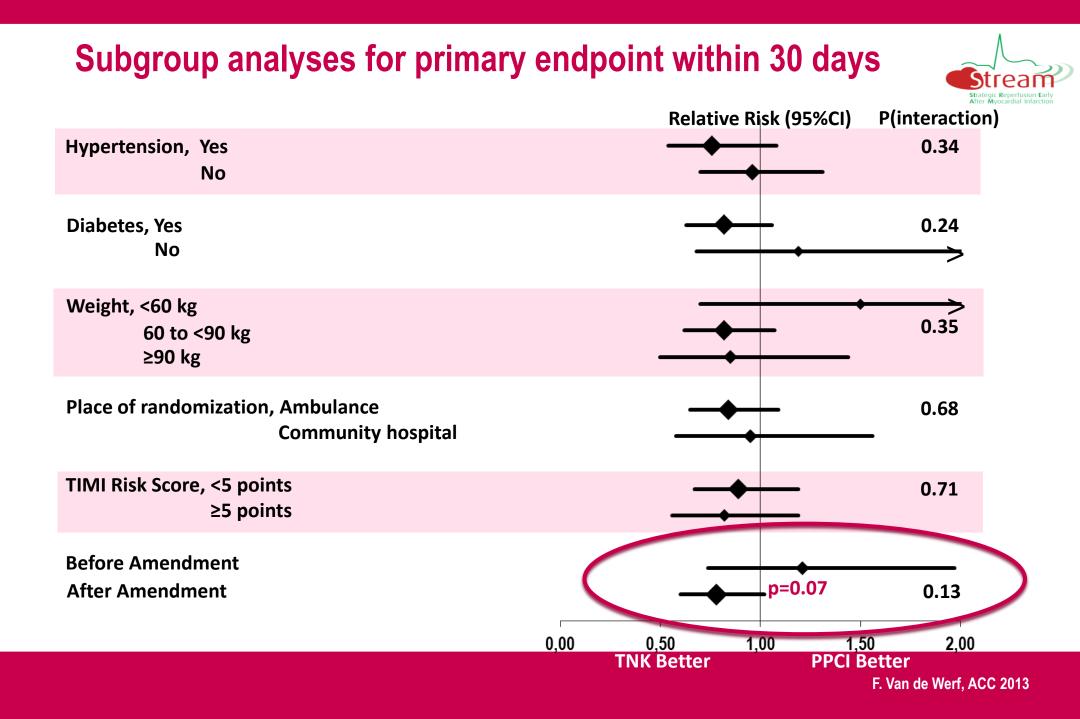

F. Van de Werf, ACC 2013

SINGLE ENDPOINTS UP TO 30 DAYS

	Pharmaco-invasive	PPCI	P-value
	(N=944)	(N=948)	
All cause death	(43/939) 4.6%	(42/946) 4.4%	0.88
Cardiac death	(31/939) 3.3%	(32/946) 3.4%	0.92
Congestive heart failure	(57/939) 6.1%	(72/943) 7.6%	0.18
Cardiogenic shock	(41/939) 4.4%	(56/944) 5.9%	0.13
Reinfarction	(23/938) 2.5%	(21/944) 2.2%	0.74

STROKE RATES

	Pharmaco-invasive	PPCI	P-value
TOTAL POPULATION (N=1892)			
Total stroke	15 /939 (1.60%)	5 /946 (0.53%)	0.03
fatal stroke	7 /939 (0.75%)	4 /946 (0.42%)	0.39
Haemorrhagic stroke	9 /939 (0.96%)	2 /946 (0.21%)	0.04
fatal haemorrhagic stroke	6 /939 (0.64%)	2 /946 (0.21%)	0.18
POST AMENDMENT POPULATION (N=1503)			
Total stroke	9 /747 (1.20%)	5 /756 (0.66%)	0.30
fatal stroke	3 /747 (0.40%)	4 /756 (0.53%)	>0.999
Haemorrhagic stroke	4 /747 (0.54%)	2 /756 (0.26%)	0.45
fatal haemorrhagic stroke	2 /747 (0.27%)	2 /756 (0.26%)	>0.999

	Pharmaco-invasive (N=944)	PPCI (N=948)	P-value
Major non-ICH bleeding	6.5%	4.8%	0.11
Minor non-ICH bleeding	21.8%	20.2%	0.40
Blood transfusions	2.9%	2.3%	0.47

A strategy of fibrinolysis with bolus tenecteplase and contemporary antithrombotic therapy given before transport to a PCI-capable hospital coupled with timely coronary angiography :

- circumvents the need for an urgent procedure in about two thirds of fibrinolytic treated STEMI patients.
- is associated with a small increased risk of intracranial bleeding.
- is as effective as primary PCI in STEMI patients presenting within 3 hours of symptom onset who cannot undergo primary PCI within one hour of first medical contact.

Reperfusion: Conclusions Anno 2013

- Reperfusion therapy is the most effective treatment to offer to STEMI patients and is its broad application has significantly reduced case fatality rates both in studies and in the real world over the last 20 years
- Major efforts are still needed to shorten delay times especially in patients presenting first to facilities without a cath lab
- Distances, weather and traffic conditions are a frequent reason why patients can't get timely PCI
- Especially in patients presenting early to an ambulance system or hospital without a cath lab fibrinolytic therapy should be considered when there is any doubt about timely PCI
