Small Molecules Can Improve Cardiac Function…

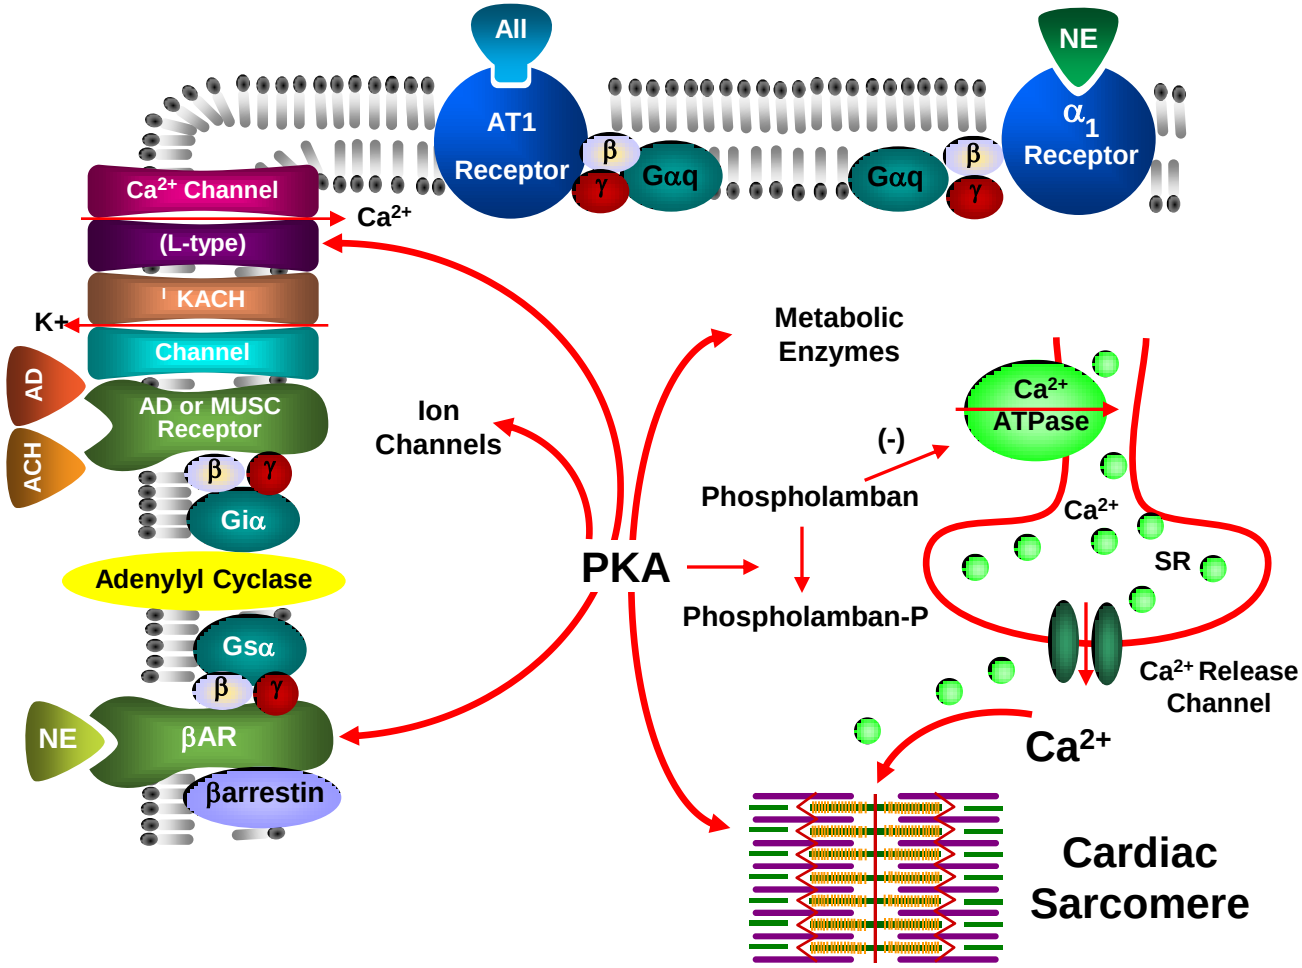
Indirect Mechanisms

PKA phosphorylates proteins throughout the myocyte

↓

Intracellular [Ca^{2+}] increases

↓



… But They Compromise CardiacPerformance

Indirect Mechanisms

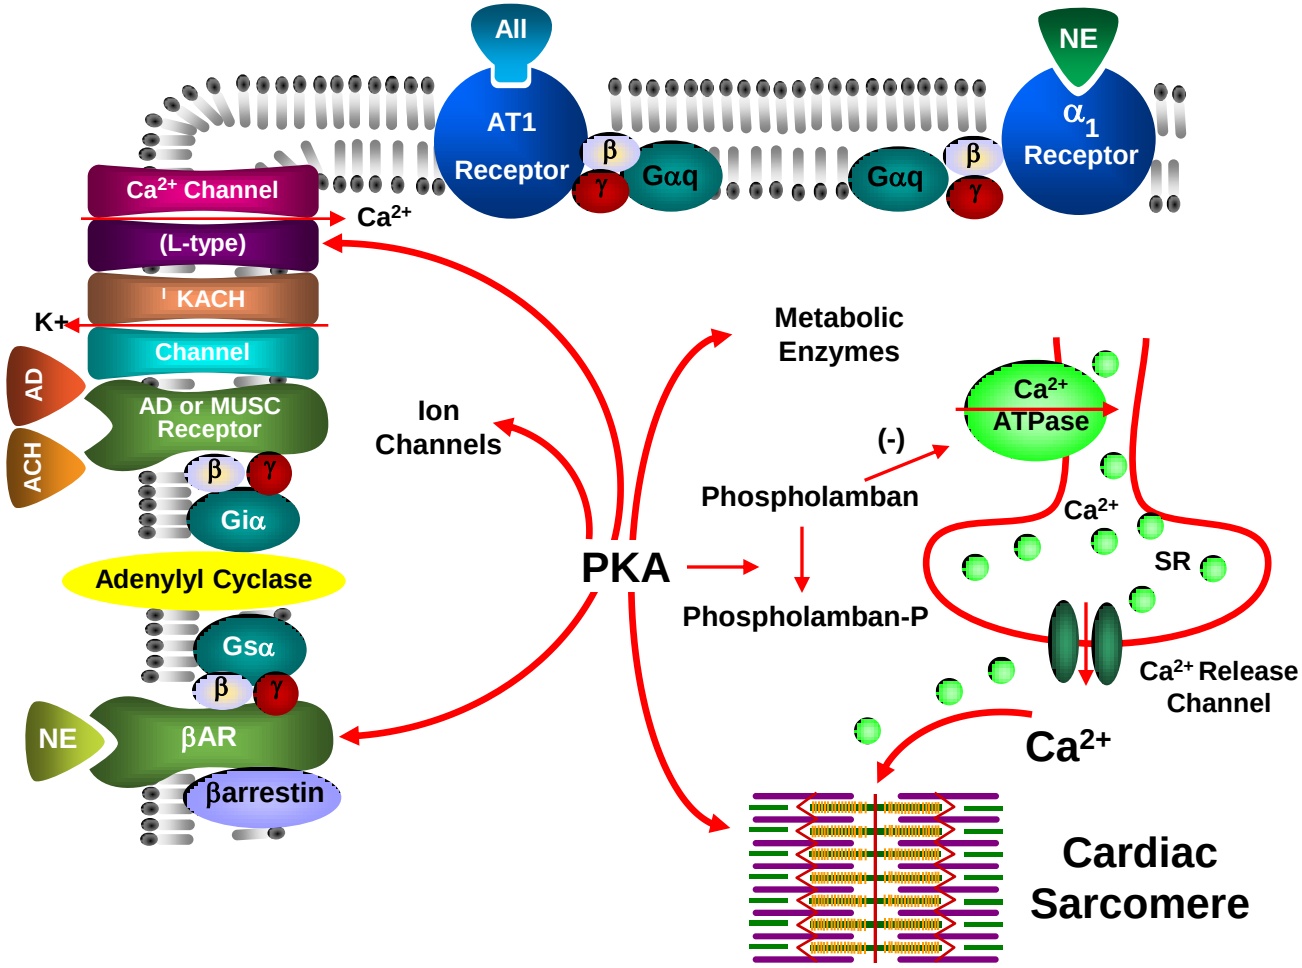
PKA phosphorylates proteins throughout the myocyte

↓

Intracellular [Ca^{2+}] increases

↓

- ↑ Contractility
- ↑ Heart rate
- ↓ Blood Pressure
- ↑ O_2 Demand
- ↓ Efficiency
- ↑ Arrhythmias



Dobutamine (β-agonist), Milrinone ($PDE3_i$)

Potential Advantages of Targeting the Sarcomere

Therapeutic Hypothesis

Directly target the sarcomere

Ø PKA activation

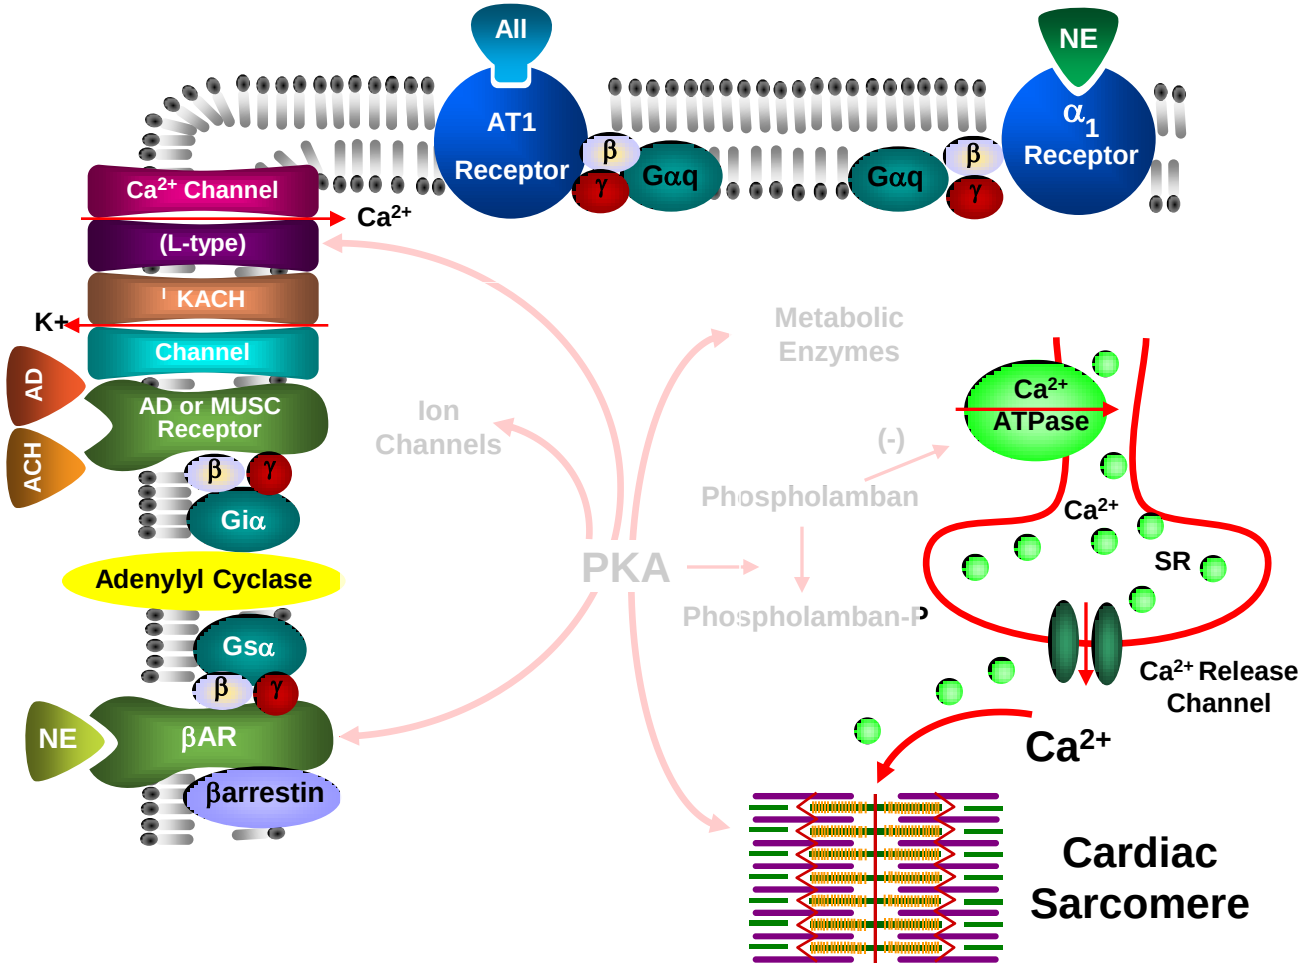
↓

Intracellular [Ca^{2+}] unchanged

↓

- ↑ **Contractility**
- ↔ **Heart rate?**
- ↔ **Blood Pressure?**
- ↔ **O_2 Demand?**
- ↑ **Efficiency?**
- ↔ **Arrhythmias?**

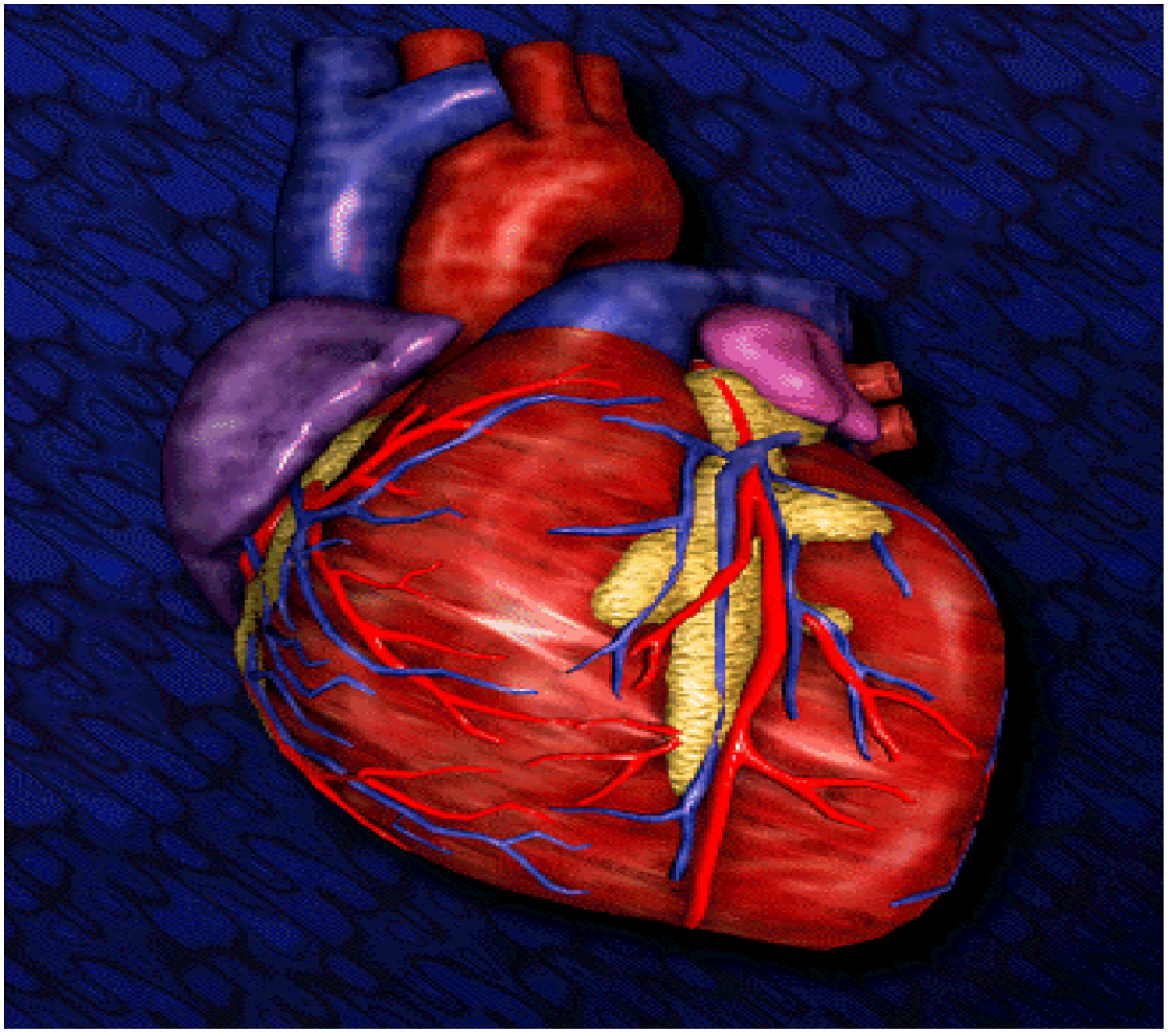
Effective Drug?



Inotropes

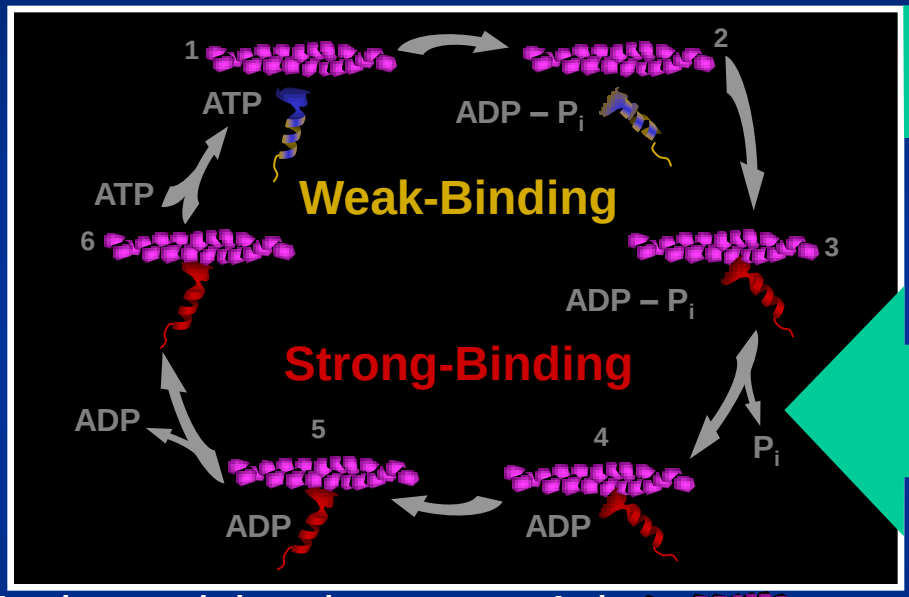
Omecamptiv Mecarbil

and Direct Cardiac Myosin Activation



Postulated Mechanism of Action for Cardiac Myosin Activators

Chemical and mechanical cycles are linked



Cardiac myosin activators increase the actin-myosin transition rate from weak to strong binding states[1]

Cardiac myosin activators increase the number of "independent force generators" (myosin heads) interacting with the actin filament

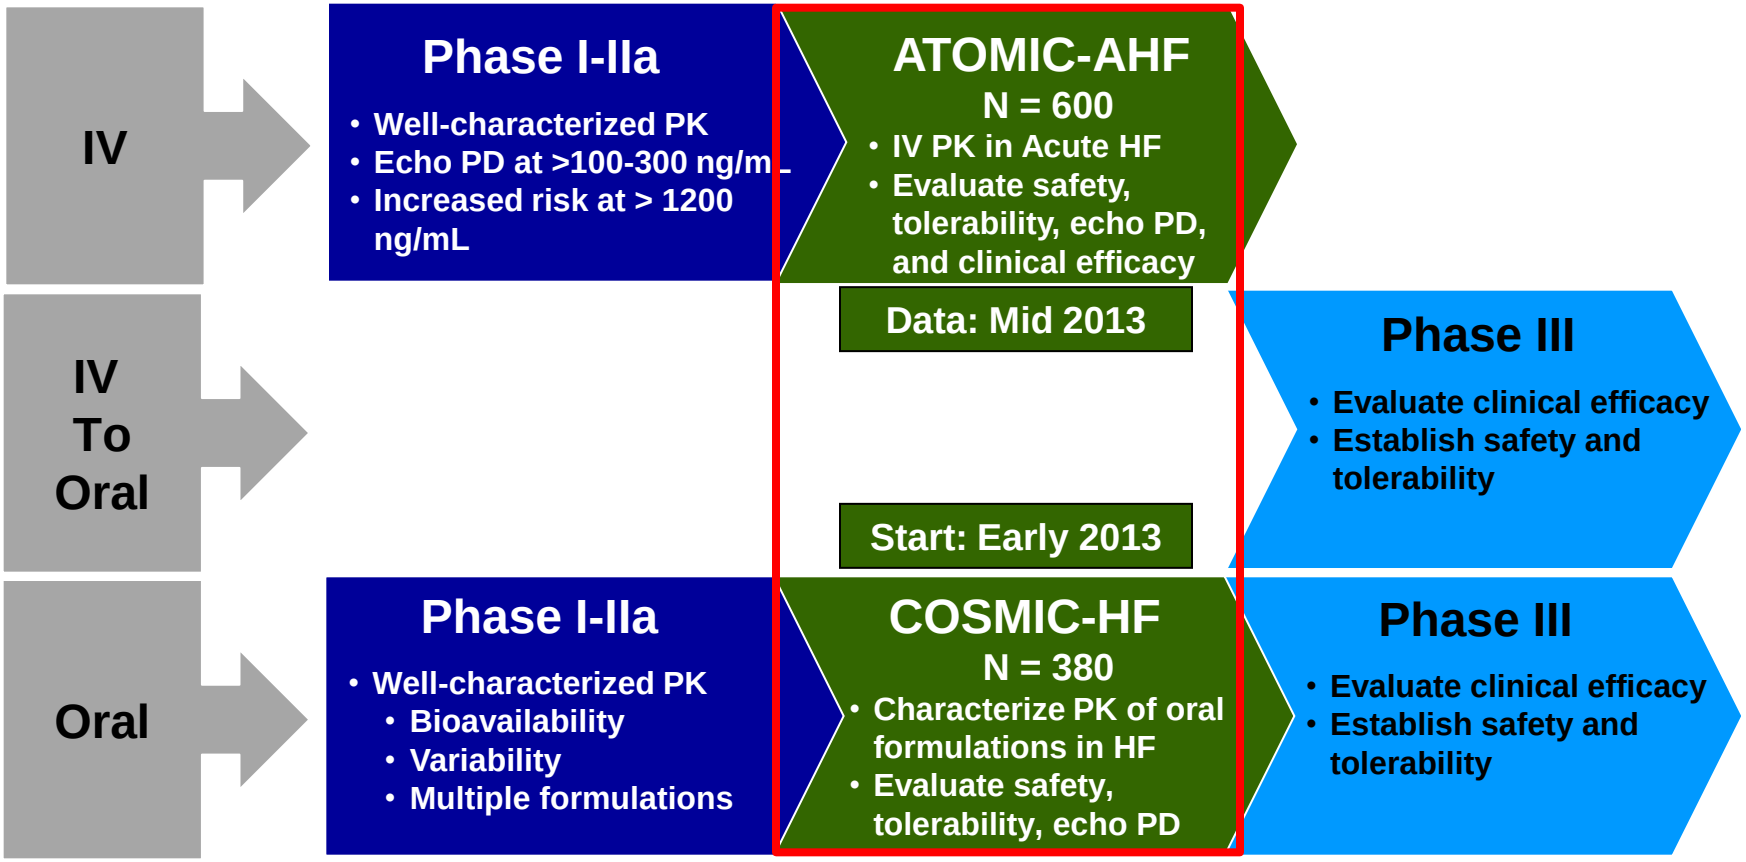
N: number of patients in the bin, n: number of observations in the bin. Heart rate measured by ECG. Control = observations in Placebo + PK below quantification limit. PK bin concentration analysis: repeated measures analysis of covariance. Linear regression slope analysis: repeated measures multiple linear regression.

Omecamtiv Mecarbil: Development Across Continuum of Care



IV and oral formulations enable evaluation of *omecamtiv mecarbil* across a range of heart failure patient populations

Summary

- Efficacy
  - OM did not meet the 1° endpoint of dyspnoea relief
  - Appeared to improve dyspnoea in Cohort 3
  - Trends towards reduction of worsening HF
- Safety
  - Overall SAE profile and tolerability similar to placebo
  - Increase in troponin; no clear relationship to OM concentration
  - Numerical imbalance in MIs in Cohort 3
  - No evidence of pro-arrhythmia
- Pharmacology
  - PK similar to healthy volunteers and stable HF patients
  - Systolic ejection time significantly increased consistent with MOA
  - Small fall in heart rate & rise in systolic BP at higher doses

Thank You!

ATOMIC-AHF: Study Objectives

Study Objectives

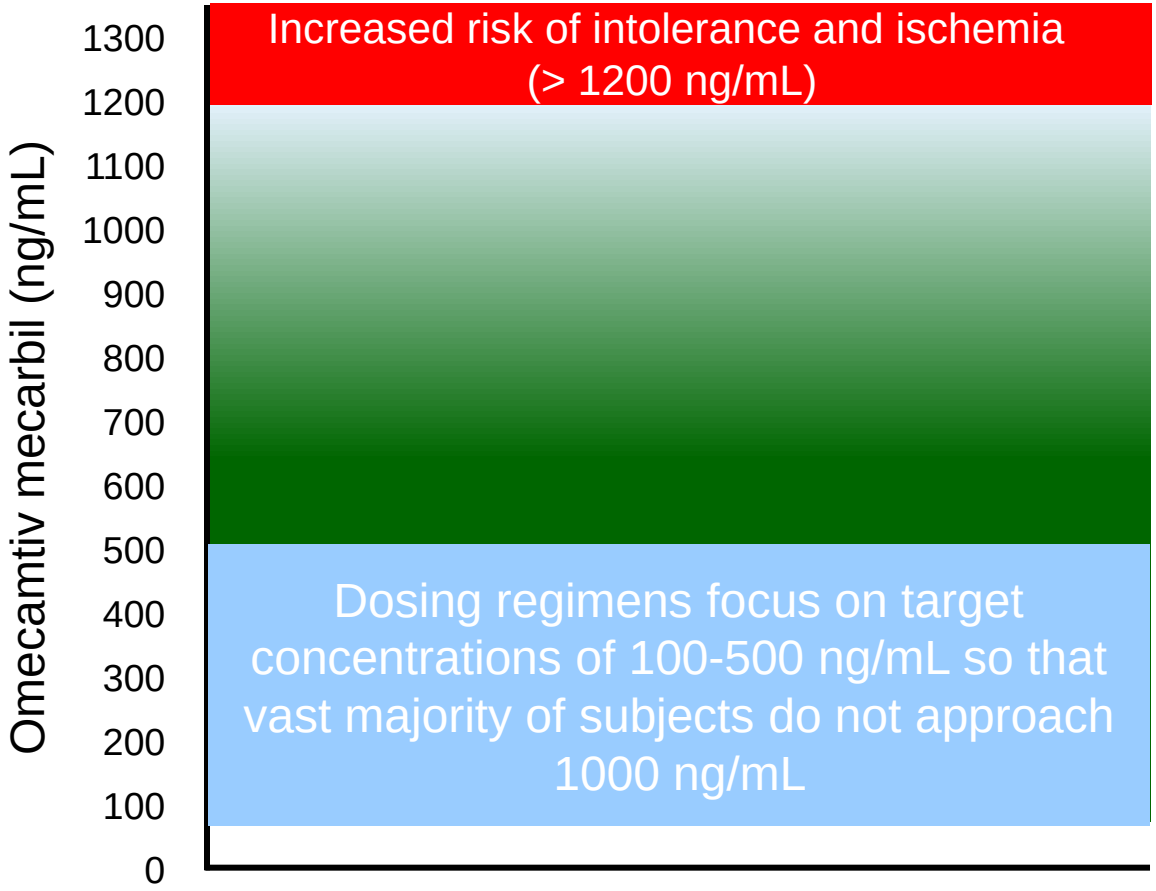
- Primary
  - Evaluate the effect of 48 hours of intravenous (IV) omecamtiv mecarbil (OM) compared with placebo on dyspnea in subjects with left ventricular systolic dysfunction hospitalized for acute heart failure (AHF)
- Secondary
  - Assess the safety and tolerability of 3 dose levels of IV omecamtiv mecarbil (OM) compared with placebo in subjects with left ventricular systolic dysfunction hospitalized for AHF
  - Evaluate the effects of 48 hours treatment with IV OM on dyspnea (different measurement than primary), patient global assessment (PGA), change in NT-pro BNP and short-term clinical outcomes
  - Characterize PK of OM, including major metabolites, following IV infusion and evaluate the relationship between OM plasma concentration and echocardiographic parameters in subjects with acute heart failure

ATOMIC-AHF: Inclusion Criteria

KEY Eligibility Criteria – Inclusion

- Male/female ≥ 18 and ≤ 85 years of age at the time of randomization
- History of chronic heart failure (defined as requiring treatment for heart failure for a minimum of 30 d before hospitalization)
- History of left ventricular ejection fraction (LVEF) ≤ 40% (echocardiogram, radionuclide ventriculography, cardiac magnetic resonance imaging, or contrast ventriculography) without an intervening value of > 40%
- Dyspnea, due to heart failure, at rest or with minimal exertion
- Screening BNP ≥ 400 pg/mL or NT-proBNP ≥ 1600 pg/mL during screening (BNP ≥ 600 pg/mL or NT-proBNP ≥ 2400 pg/mL if the subject has atrial fibrillation)

Omecamtiv Mecarbil: Pharmacodynamics and Tolerability are Concentration-dependent



PK/PD Substudy Endpoint: Change in Systolic Ejection Time (SET)

PK Concentration Bin Analysis	Control	OM Concentration Bin 1	OM Concentration Bin 2	OM Concentration Bin 3
OM concentration range (ng/ml)		≥88-200	>200-300	>300-787
Change in SET (msec)				
N(n)	45 (88)	10 (18)	15 (23)	12 (19)
LS mean	-6.7	16.6	26.9	46.4
Difference from control		23.4	33.6	53.2
95% CI		(7.4, 39.4)	(19.8, 47.4)	(38.0, 68.3)
p-value		0.005	<0.0001	<0.0001
Linear regression slope	$p < 0.0001$			

Baseline systolic ejection time for all patients was 258 msec. N: number of patients in the bin, n: number of observations in the bin; Control = observations in Placebo + PK below quantification limit; PK bin concentration analysis: repeated measures analysis of covariance; Linear regression slope analysis: repeated measures multiple linear regression.

Efficacy Endpoints

Primary:

- Dyspnoea symptom response (7-point Likert scale) through 48 hours

Secondary:

- Death (any cause) and/or worsening heart failure within 7 days
- Dyspnoea area under the curve (AUC) (baseline to 5th day or discharge) as measured by subject self-assessed Numerical Rating Scale (NRS)
- Dyspnoea by 7-point Likert scale at each scheduled assessment
- Patient Global Assessment response through 48 hours
- Change from baseline in NT-proBNP
- Length of initial hospital stay
- Days alive out of hospital until day 30

PK/PD (Echo) Sub-study

ATOMIC-AHF

Acute **T**reatment with **O**mecamtiv **M**ecarbil to **I**ncrease **C**ontractility in **A**cute **H**eart **F**ailure

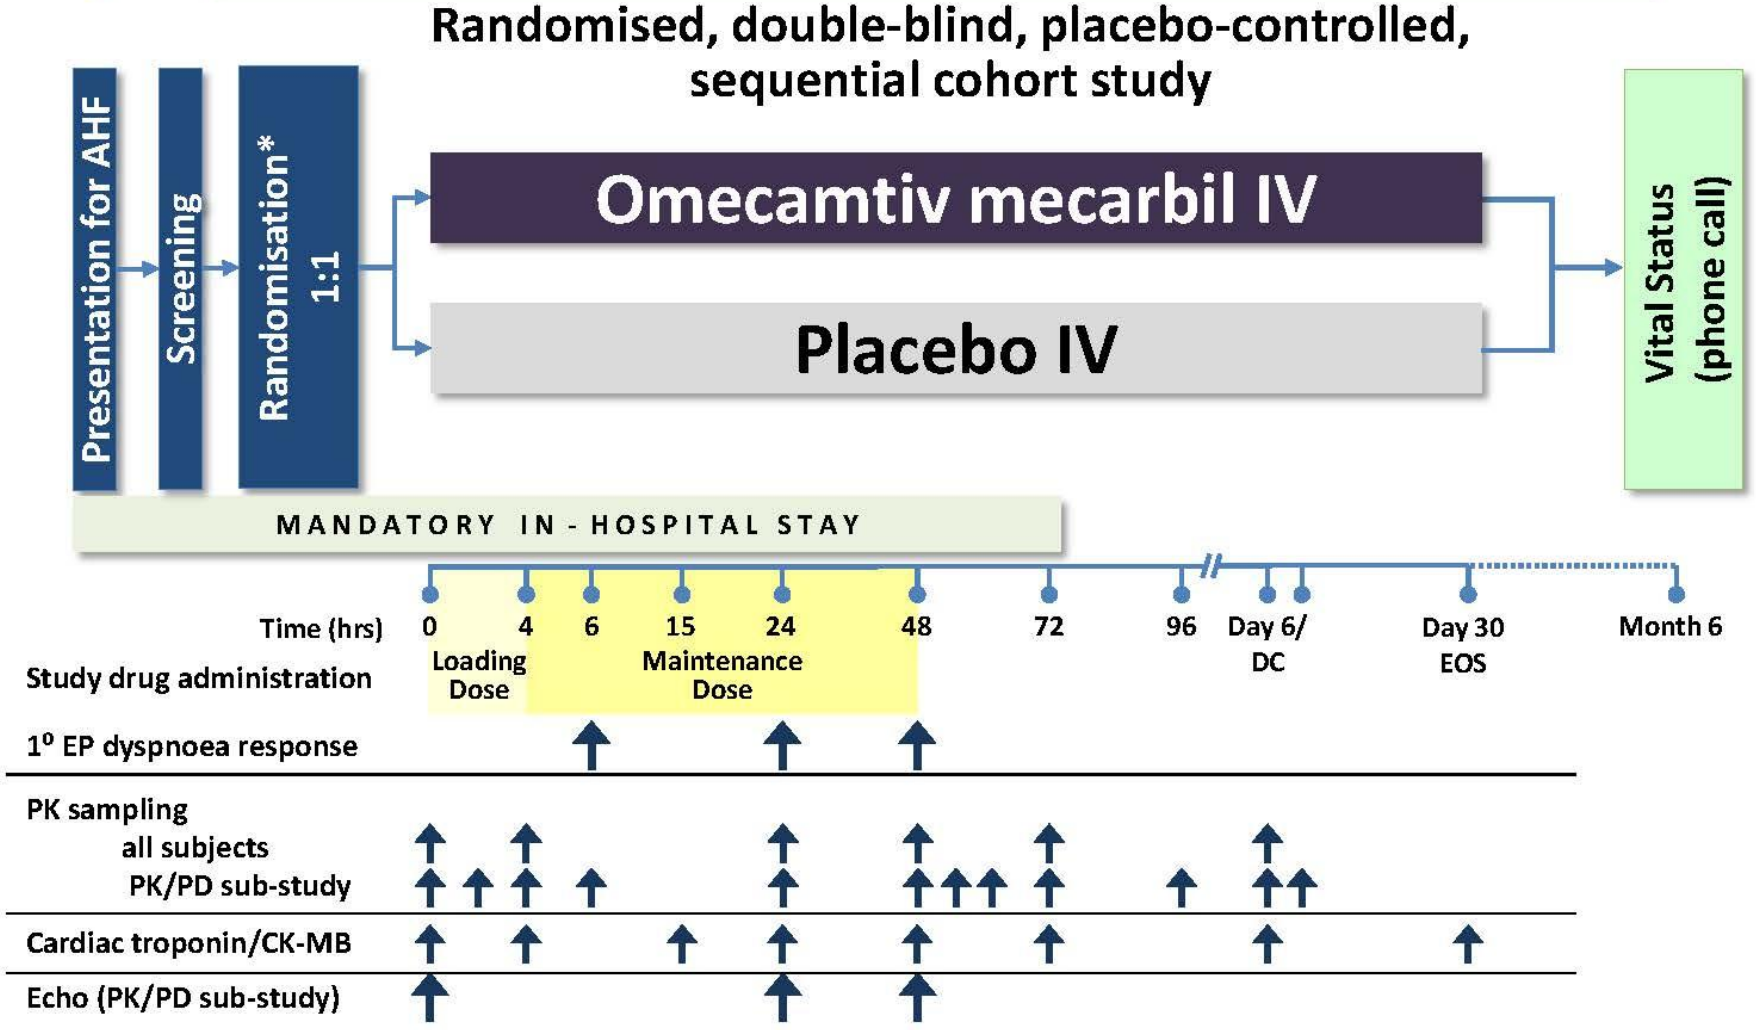
Objective:

- To evaluate the safety, pharmacokinetics/ pharmacodynamics, and efficacy of IV omecamtiv mecarbil (OM) in patients with acute heart failure (AHF)

Hypothesis:

- At least 1 dose level of IV OM will be well tolerated and will result in improvement of dyspnoea in subjects with left ventricular systolic dysfunction hospitalised for AHF

Study Design



* Randomisation within 24 hours of initial IV diuretic (Amendment 2)

OM aktuelle klinische Studie (geplant 600 Pat.)
