Abstract

Case from the [Contrast Echo Box](#)
[Detection of Ischaemia](#)

Introduction

Patient with recurrent episodes of chest pain, no baseline ECG abnormalities. Significant diffuse downsloping ST depression but no chest pain on treadmill. (fig 1-2)

Case Report

Contrast Stress Echocardiogram

Dipyridamole (0.84mg/kg/6min) contrast stress echocardiogram (fig 3-4)

Normal contrast perfusion at stress makes obstructive CAD extremely unlikely
