The 5th National Heart Failure Societies’ Presidents’ Summit discussed and unanimously adopted a Call For Action in support of the Heart Failure Association’s (HFA) and the European Society of Cardiology (ESC) Global Heart Failure Awareness Programme. The Summit, attended by 36 National Heart Failure Societies and the board of the HFA/ESC, recognised the urgent need for action to improve patient outcomes dramatically and reduce the burden of heart failure on society and health systems. The Global Burden of Heart Failure

New and recent advances in diagnosis and treatments mean that heart failure is preventable. Most patients with heart failure can be treated more effectively, improving their quality of life and chances of survival. Heart failure carries a huge economic burden for societies, healthcare systems and for the individual patient. Patients are usually diagnosed late, and therefore treated in the acute phase or at late stage disease, when hospitalisation is inevitable. Heart failure accounts for 1% of total healthcare expenditure in the developed world a staggering 62 billion in Germany, and in the US nearly 72 billion per annum. The burden of heart failure:

- Heart failure is a complex syndrome, and can arise due to many underlying problems affecting the structure and the functioning of the heart.
- In economically developed countries >1 in 5 people will die from cardiovascular disease, when hospitalisation is inevitable. Heart failure accounts for 1-3% of total healthcare expenditure in the developed world – a staggering €2.9 billion in Germany, and in the US nearly $21 billion per annum.

Admissions to hospital due to heart failure are rapidly growing. Globally, 17-45% of patients admitted to hospital with heart failure will die within 1 year, and the majority will die within 5 years.

The HFA, the world’s largest heart failure organisation, and its National Societies joined forces to recommend united action, and declared that they believed that the global burden of heart failure is huge, and cannot be allowed to continue unchallenged. Preventing heart failure must become a strategic health priority for every country.

The 6 priority actions to address global heart failure prevention are:

- Raise global awareness about heart failure and make it a universal health priority.
- Promote prevention by encouraging healthy lifestyles: exercise, diet, blood pressure control.
- Train health care professionals in order to achieve earlier diagnosis and better intervention, a key strategy to prevent hospitalisations from multiplicity/year in high-senior follow-up.
- Expand the specialisation of heart failure amongst cardiologists and nurses and educate them about the complexity of the syndrome and its causal relationship with other conditions.
- Clarify and optimise the patient pathway thereby improving earlier detection at primary care level and structured follow-up implementation.
- Support strategic and political initiatives to improve heart failure care at national level.

The Global Heart Failure Awareness Programme

The HFA will launch the Global Heart Failure Awareness Programme – an initiative that will begin in 2016 and be powered by the end of 2019.

The campaign, aimed at all stakeholders in the heart failure community, will drive better understanding and recognition of the condition on a global scale, and improve and align intervention strategies on the other. The campaign seeks to implement initiatives targeted at specific stakeholder groups, as well as more broad-based public awareness campaigns via media to reach and educate the community at large. It will promote the establishment of Centres of Excellence in heart failure and the transfer of best practice amongst countries in order to accelerate change and encourage the adoption of good strategies.

The campaign will engage with:

- The public;
- Patients, their families and carers;
- Physicians, clinicians, both at primary care level as well as specialists across the disease spectrum;
- Nurses;
- Politicians and public health professionals;
- Regulators and legislators.

The HFA, the world’s largest heart failure organisation, and its National Societies joined forces to recommend united action, and declared that they believed that the global burden of heart failure is huge, and cannot be allowed to continue unchallenged. Preventing heart failure must become a strategic health priority for every country.

A Call For Action

Agreed at the
5th National Heart Failure Societies Presidents Summit
Ljubljana, Slovenia
24 October 2015

The 5th National Heart Failure Societies’ Presidents’ Summit discussed and unanimously adopted a Call For Action in support of the Heart Failure Association’s (HFA) of the European Society of Cardiology (ESC) Global Heart Failure Awareness Programme. The Summit, attended by 36 National Heart Failure Societies and the board of the HFA/ESC, recognised the urgent need for action to improve patient outcomes dramatically and reduce the burden of heart failure on society and health systems.
