

# ATRIAL FIBRILLATION (AF)

**Anticoagulant therapy,  
coumadines  
or direct antithrombins**

Felicita Andreotti, MD PhD Aggregated Professor  
Dept of Cardiovascular Sciences, Catholic University, Rome, IT

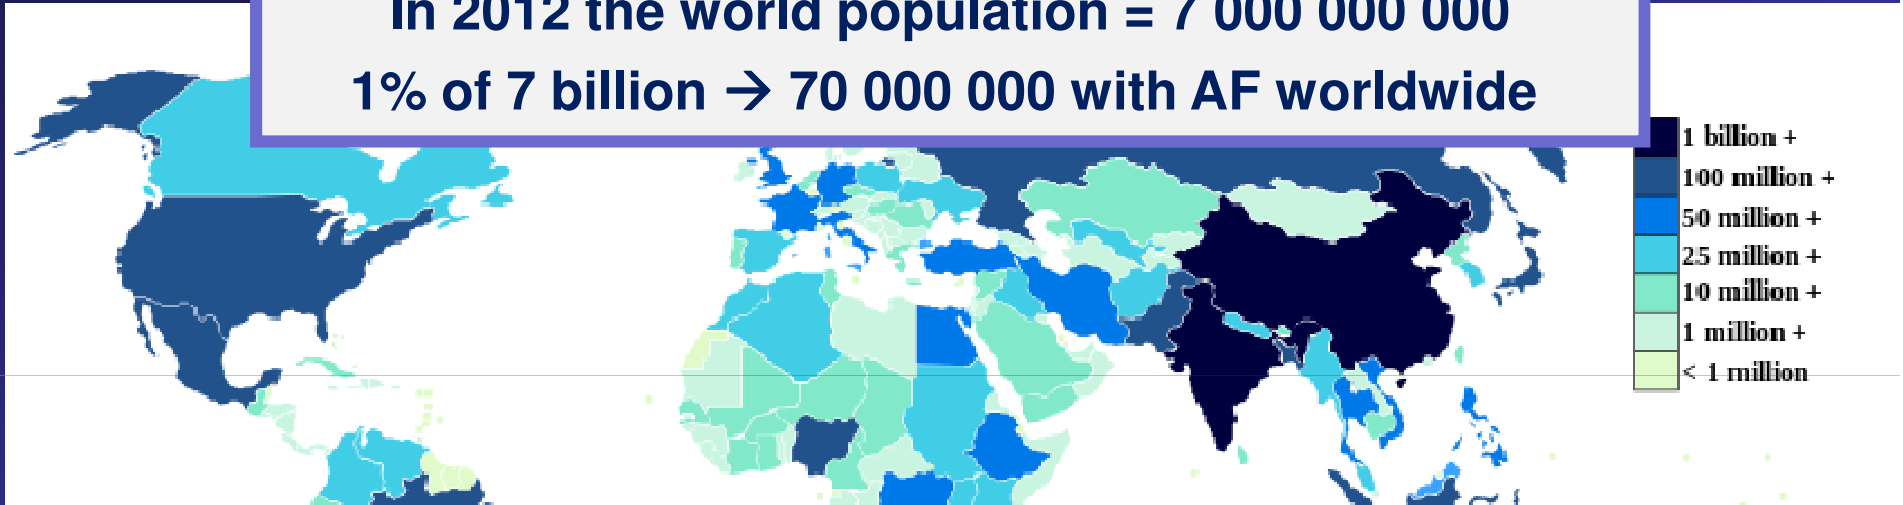

**Consultant or speaker** in past 2 years for AstraZeneca,  
Bayer, BMS-Pfizer, Daiichi-Sankyo, Eli-Lilly

# Global burden of AF and of AF-related strokes

**1% of the general population is estimated to have AF**

**In 2012 the world population = 7 000 000 000**

**1% of 7 billion → 70 000 000 with AF worldwide**

**15 000 000 strokes per year worldwide**

**Up to ~1/5 of strokes are AF-related**

**1/5 of 15 000 000 → 3 000 000 AF-related strokes per yr**

**The average annual stroke rate in untreated nonvalvular (NV)AF is ~ 5%**

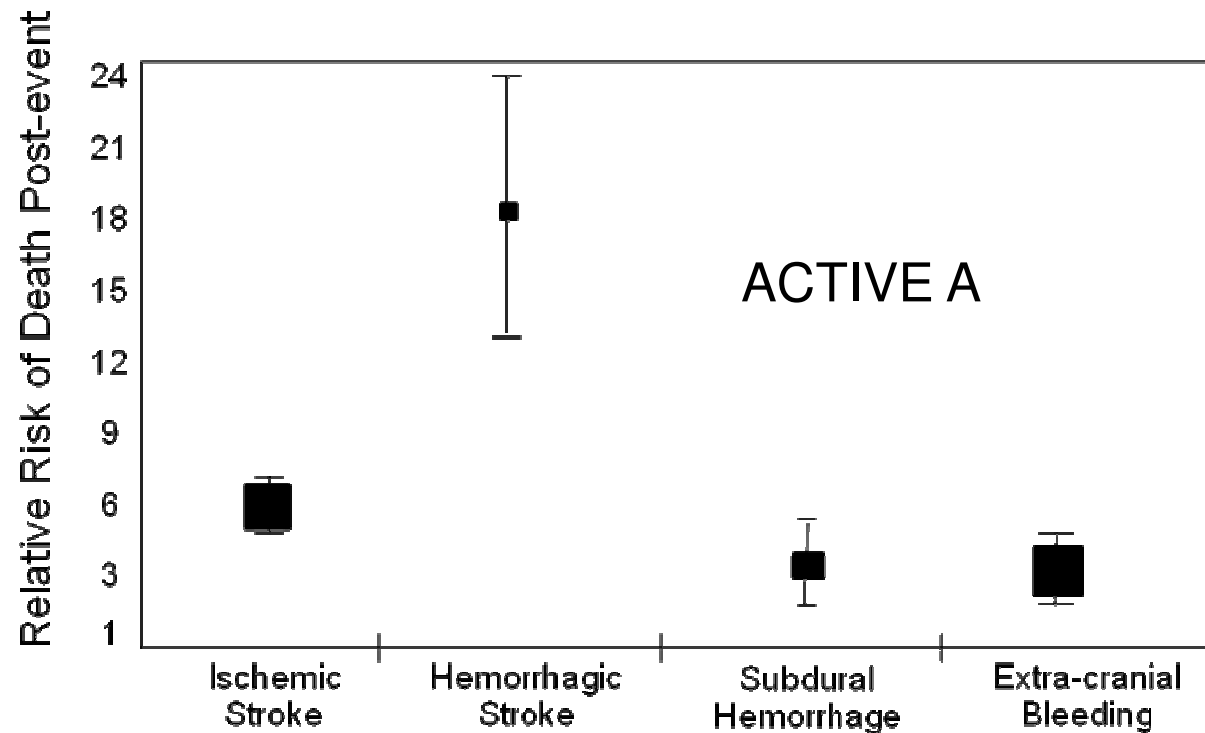

**5% of 70 million → 3 500 000 AF-related strokes per yr**

# AF-related strokes are serious

Ischemic strokes are more severe  
with, than without, AF  
Hemorrhagic strokes are the most dreaded

# Relative risk of death post-event in ACTIVE A

| Event     | Ischemic Stroke | Hemorrhagic Stroke | Subdural Hemorrhage | Extracranial Hemorrhage |
|-----------|-----------------|--------------------|---------------------|-------------------------|
| Weighting | 1.00            | 3.00               | 0.64                | 0.63                    |

# Antithrombotic therapy in NVAF

% Relative risk reduction (RRR) of Stroke or MACE\* in NVAF

Hart. J Thromb Thlysis 2008;25:26-32 – ACTIVE W. Lancet 2006;367:1903-12  
ACTIVE A. NEJM 2009;360:2067-78

# Risk of major bleeds with warfarin therapy

Annual risk of major bleed on warfarin ~2 - 3% per annum

| Study  | Year published | Population (n) | Major haemorrhage, % per year  | ICH % per year | New to warfarin, % | Age, mean |
|--|----------------|----------------|--------------------------------|----------------|--------------------|-----------|
| <b>Randomised trials</b>                             |                |                |                                |                |                    |           |

# CONCLUSIONS

NOACs vs coumadin, in patients with nonvalvular atrial fibrillation, can prolong life and improve its quality through stroke prevention, are generally safer and more convenient, and are projected to be cost-effective

# Conclusions

---

## **A new era of anticoagulation for patients with NVAF**

- All 3 new OACs are non inferior to warfarin in reducing the risk of stroke and systemic embolization
- All three agents reduce the risk of life-threatening bleeding and intracranial hemorrhage

## **Differences and Future Challenges:**

- Dabigatran has a 2-dose approach to the treatment of patients with AF; at a dose of 150 mg it was associated with a reduction in ischemic stroke.
- Rivaroxaban is a once a day drug associated with a lower rate of fatal bleeding
- Apixaban was associated with a reduction in all-cause mortality

## Other established thromboembolic risk factors

On TEE, the presence of

- LA thrombus (RR 2.5; P=0.04),
- complex aortic plaques (RR 2.1; P<0.001),
- spontaneous echo-contrast (RR 3.7; P<0.001), and
- low LAA velocities ( $\leq 20$  cm/s; RR 1.7; P<0.01)

are independent predictors of stroke and thromboembolism
